

# Broaching Process Application

For a wide range of parts

Customized and adapted solutions

Provide high productivity, efficiency, accuracy as well as reliability

Low maintenance cost

→ Designing today the machining solutions of the future

Cinetic Machining develops different ranges of brand new, total or partial broaching solutions to serve special industry needs.

Thanks to its experience in refurbishing and transformation of horizontal and vertical broaching machines, **Fives Cinetic** has designed and developed a horizontal broaching machine especially designed to broach discs and turbine blades. With its many references and its unique expertise in the area of broaching, **Fives Cinetic** is able to develop specific broaching solutions according to your specific needs.

Cinetic Machining develops broaching machines especially dedicated to:

- The Aircraft Industry
- The Automotive Industry
- The Energy Industry

According to the shape to be obtained, there are various types of solutions:

- Vertical or horizontal machining
- High broaching speed
- Adapted power and pulling force
- High efficiency using multi line broaching process
- Complementary full CNC axis controlled
- Auxiliary and optional equipments
